We claim:

- A device for measuring electrical potential in a 1 2 sample comprising: an electrode body formed with two electrically separate 3 surfaces positioned to contact simultaneously a sample; 4 a electrical excitation source connected to one of said 5 surfaces for feeding an electrical excitation signal to said 6 7 sample; and an electrical potential measuring unit connected to the 8 other of said surfaces for measuring an electrical potential in 9 said sample resulting from application of said electrical 10 excitation signal to said sample. 11
 - 2. The device defined in claim 1 wherein the area of said other of said surfaces for measuring said electrical potential in said sample is smaller by a factor of at least 10 than the area of said one of said surfaces for feeding said electrical excitation signal to said sample.
 - 3. The device defined in claim 1 wherein the two electrically separate surfaces are separated by an annular insulator.

- 4. The device defined in claim 1 wherein said other of said surfaces for measuring an electrical potential in said sample is formed upon a pointed tip of said body adapted to be driven into said sample.
- 5. The device defined in claim 4 wherein said one of said surfaces is a jacket of said body.
- 6. The device defined in claim 5 wherein said body is a spike adapted to be driven into the ground.
- 7. The device defined in claim 6 wherein said tip of said spike is a solid metal tip.
- 1 8. The device defined in claim 7 wherein said jacket 2 is a metal tube.
- 9. The device defined in claim 8 wherein the tip of said spike is composed a more noble metal than said jacket.

- 1 10. The device defined in claim 9 wherein the jacket 2 is separated from the tip by an annular insulator.
- 1 11. The device defined in claim 10, further comprising
 2 a flexible electrical conductor extending upwardly through said
 3 tube and connected to said tip.
- 1 12. The device defined in claim 11, further comprising
 2 an insulator extending through said tube and separating said
 3 flexible electrical conductor from said jacket.
- 13. The device defined in claim 10, further comprising 2 a solid metal rod or tube extending upwardly from said tip 3 through said jacket to supply an electrical potential measurement 4 to an electric circuit.
- 14. The device defined in claim 13, further comprising 2 an insulating tube surrounding said solid metal rod or tube for 3 insulating said solid metal rod or tube from said jacket.

1 15. An apparatus for measuring conductivity of a 2 sample, comprising two electrode bodies each formed with two electrically separate surfaces positioned to contact 3 4 simultaneously a sample, said electrode bodies being spaced apart 5 in said sample; a electrical excitation source connected to one of said surfaces of each electrode body for feeding an electrical 6 7 excitation signal through said sample; and an electrical 8 potential measuring unit connected to the other of said surfaces of each electrode body for measuring an electrical potential 9 10 across said sample resulting from application of said electrical 11 excitation signal to said sample.

tomographic electrical conductivity distribution in a sample, comprising a plurality of electrode spikes driven into the ground in spaced-apart relationship, each of said spikes comprising an electrode body formed with two electrically separate surfaces positioned to contact simultaneously said sample;

a electrical excitation source connected to one of said surfaces of each spike for feeding an electrical excitation signal to said sample; and

an electrical potential measuring unit connected to the other of said surfaces of said spikes for measuring an electrical

- 12 potential in said sample resulting from application of said
- 13 electrical excitation signal to said sample.
